Update: Upcoming Changes for Classic OPzS Blocks

As part of a continuous improvement process, the Classic OPzS Solar and Classic OPzS blocks ranges will be manufactured with new lids and containers (similar to the new Sonnenschein A600 blocks) starting from **December 2013** with progressive implementation for each model. The new plastic material will be a grade of polypropylene which enables an excellent quality of welding between the lid and the container, creating a tight and durable seal.

For the flooded OPzS & OPzS Solar blocks, the new lids will be red and the containers will be translucent, to allow an excellent visibility inside the battery. The plugs remain the same (M27 screwed type).

Sample of Classic OPzS block with new translucent material and new lid design

There will be new part numbers for all blocks, ending with the letter B instead of A.

Example:

6V 4 OPzS 200

Current part number: NVZS060200WC0FA

New part number (from December 2013 on): NVZS060200WC0FB

Additionally, the connectors and bolts design will be changed, providing full insulation both on the connector itself and the bolt. There will be full compatibility between old and new connectors; as well as between old and new design for the blocks.
